

BootHop

UK Peer-to-Peer Delivery Marketplace | www.boothop.com

BootHop Mobile App - iOS & Android Reference (v1.2.0)

Version 2.0 | August 2025 | Confidential - Internal Use Only

WHAT IS BOOTHOP?

BootHop is a UK-registered peer-to-peer delivery marketplace that connects Hoopers (people who need goods transported) with Booters (travellers with spare luggage capacity). Instead of paying for a courier, senders pay travellers who are already flying or driving the route - achieving 60-80% savings while travellers earn extra income on trips they were already making.

BootHop handles the full logistics chain: item posting, AI safety checks, KYC identity verification, in-app messaging, a tamper-evident QR seal system, real-time delivery tracking, and manual escrow payment release. A Business Portal serves SMEs needing same-day or priority deliveries, and a Priority Partner tier provides SLA-backed enterprise logistics with dedicated carriers. The platform operates across the web (boothop.com) and via native iOS/Android apps (BootHop Mobile v1.2.0).

v1.2.0

Version

WHAT'S IN THIS DOCUMENT

- Section 1 - Onboarding & Authentication (4 screens): First-run onboarding carousel, Email OTP login, OTP verification, Role selection.
- Section 2 - Main Tabs (5 screens): Home dashboard, Journeys marketplace, Messages inbox, Profile management, Business tab.
- Section 3 - Journey & Request Creation (2 screens): Post a carrier trip, Post a delivery request.
- Section 4 - Match Flow (5 screens): Match detail hub, Item declaration form, Carry-on inspection, Stripe payment checkout, In-app chat.
- Section 5 - Delivery & Sealing (5 screens): QR seal activation, Seal confirmation, Delivery confirmation, Delivery PIN, Issue reporting.
- Section 6 - Tracking (2 screens): Barcode/QR status tracking, Live GPS delivery map.
- Section 7 - Business (1 screen): Mobile business job booking.

- API Layer: All 24 screens call the same API endpoints as the web (constants/index.ts). All web APIs are fully compatible with the mobile app.
- base URL <https://www.boothop.com/api>

SECTION 1 - ONBOARDING AND AUTHENTICATION

First-run experience and OTP-based login - no password required

Onboarding Screen	Mobile	First-Run Welcome: Shown once on first launch. Animated 3-card carousel explaining BootHop in under 60 seconds: (1) "Send anything, anywhere - pay less than a courier", (2) "Earn money on trips you're already making", (3) "Verified carriers. Sealed packages. Tracked delivery." Large "Get Started" button leads to Login. Skip button takes directly to the Home tab. <i>Only shown on first launch. Uses AsyncStorage to track whether onboarding has been seen.</i>
Login (auth/login)	Mobile	Email OTP Login: User enters their email address. App calls /api/auth/send-otp, which sends a 5-character code by email via Resend. Redirects to the Verify OTP screen. Rate-limited on the server side. If a returnUrl parameter was passed (e.g. from a deep link), it is preserved through the auth flow and honoured after login. Back gesture from onboarding is blocked (cannot go back to onboarding once login starts). <i>Shares the same OTP backend as the web - same /api/auth/send-otp endpoint.</i>
Verify OTP (auth/verify)	Mobile	OTP Code Entry: 5-character input (4 digits + 1 letter). Calls /api/auth/verify-otp. On success, issues a JWT token stored in SecureStore (Expo's encrypted on-device key store - not AsyncStorage). 10-minute countdown timer shown. "Resend Code" button available after 60 seconds. On success, navigates to the Intent screen (new users) or Home (returning users). <i>Token stored in SecureStore - the mobile equivalent of an httpOnly cookie. Never stored in plain AsyncStorage.</i>
Role Intent (auth/intent)	Mobile	Choose Your Role: Post-login role selection screen (shown once to new users). Two large tappable cards: "I want to SEND a package" (teal, routes to Request Create), "I want to CARRY and EARN" (blue, routes to Journey Create). Role preference is saved to the user record via /api/users/me/role. Returning users skip this screen.

SECTION 2 - MAIN TAB SCREENS

The four persistent bottom-tab screens visible after login

Home Tab (tabs/index)	Mobile	Home Dashboard: The main landing screen after login. Split view: top half is a hero section with live stats (active carriers, live journeys on popular routes, delivered this week). Bottom half is a smart action panel - adapts to the user's recent activity. If the user last sent an item: shows their active matches with status chips and quick-action buttons. If the user last carried: shows their posted journeys and earnings total. Unauthenticated users see a marketing version with "Send" / "Earn" action buttons. <i>Calls /api/dashboard. Shows the most relevant next action based on match status.</i>
Journeys Tab (tabs/journeys)	Mobile	Browse Carrier Journeys: Full marketplace of active carrier journeys. Each card shows: Origin -> Destination, Departure Date, Spare Capacity (kg), Price per kg (GBP), Carrier rating (stars), Airline name if disclosed. Search bar filters live by city name. Pull-to-refresh reloads from /api/journeys. "Express Interest" button on each card initiates a match request. Non-logged-in users are redirected to login on interest expression.
Messages Tab (tabs/messages)	Mobile	Messages Inbox: Unified inbox of all match chat threads. Each row: other party's first name and avatar, route summary (Lagos -> London), last message preview (truncated 50 chars), timestamp, unread badge count. Tapping opens the Chat screen for that match. Content filtering is active - phone numbers, emails, and social handles in previews are masked as "*****".
Profile Tab (tabs/profile)	Mobile	My Profile: View and edit profile details. Shows: Avatar (tap to upload from camera roll or take a new photo), Full Name, Email (read-only), Phone Number, KYC Status badge (Unverified/In Progress/Verified), Member Since. Settings section: Notification Preferences (toggle email and push for match updates, payments, promos), Log Out button. Profile photo uploaded to Supabase Storage via /api/users/upload-avatar.
Business Tab (tabs/business)	Mobile	Business Delivery Tab: Entry point to business delivery features on mobile. Shows: "Book a Business Delivery" CTA (routes to business/book screen), recent business jobs (if user has a linked business account), and promotional content about the Business Portal. Non-business users see a sign-up prompt for the portal.

SECTION 3 - JOURNEY AND REQUEST CREATION

Entry-point screens for carriers and senders to post to the marketplace

Post a Journey (journey/create)

Mobile

Post a Carrier Trip: The main carrier (Booter) creation screen. Fields: Origin City, Origin Country (dropdown), Destination City, Destination Country (dropdown), Departure Date (date picker), Arrival Date, Airline, Flight Number (optional), Spare Capacity (kg, numeric), Price per kg (GBP), Notes / Item Restrictions (free text). Submits to /api/journeys via POST. Journey becomes immediately visible in the marketplace. Validation: all required fields, capacity must be > 0, price must be > 0.
AI safety check NOT yet wired into the mobile journey create screen (available via web /journeys/create and /ai-check). Planned for v2.1.

Post a Delivery Request (request/create)

Mobile

Post a Package to Send: The sender (Hooper) screen for posting a new delivery request. Fields: Destination City, Destination Country (dropdown), Item Size (segmented picker: Small <1kg / Medium 1-5kg / Large 5-15kg / Extra Large 15kg+), Weight (kg, auto-populated from size selection but editable), Item Description (free text), Reward Offer (GBP), Latest Delivery Date (optional). Submits to /api/trips via POST (type: "request"). On success, shows an alert and navigates back to the Home tab.

SECTION 4 - MATCH FLOW SCREENS

Screens reached after a match is confirmed - one per stage of the delivery pipeline

Match Detail (match/[id])

Mobile

Match Hub: Central screen for a confirmed match. Tabs: Details, Chat, Timeline. Details tab shows: match route, item description, agreed reward, departure date, both party profiles (name, rating, KYC badge). Status timeline strip at top shows current status with colour coding. Action buttons below timeline change based on role and status: "Agree to Terms", "Commit to Delivery", "Start KYC", "Open Declaration", "Confirm Delivery". Tapping each action routes to the appropriate screen.
Status progression: matched -> agreed -> committed -> kyc_pending -> kyc_complete -> payment_processing -> active -> delivery_confirmed -> completed.

Item Declaration (declare/[id])

Mobile

Customs Item Declaration: Multi-part declaration form with full parity to the web version. Sections: (1) Item Category (40+ HMRC customs categories in a searchable picker), (2) Detailed Description, (3) Country of Origin, (4) Declared Value (GBP), (5) Quantity, (6) Is this a gift? (Yes/No toggle), (7) Prohibited Items Checklist (15 categories: weapons, drugs, currency, etc. - each must be explicitly confirmed), (8) Photo Evidence (uses expo-image-picker - camera or gallery), (9) Legal Acknowledgement (typed signature). Form can be saved as a draft at any point. Submit calls /api/declarations/[id].
Photo evidence is uploaded via /api/declarations/[id]/evidence. Accepts JPEG, PNG, HEIC up to 10MB per image.

Carry-On Inspection (inspect/[id])	Mobile	Carrier Inspection Confirmation: Carrier-side screen confirming physical inspection of the item before collection. Checklist with 5 mandatory items (all must be ticked): Packaging is intact and undamaged, Item matches the description provided, No prohibited items detected, Weight is consistent with the declaration, Inspection was conducted in the presence of the sender. Tapping "Confirm Inspection" submits to /api/matches/[id]/inspect and advances match to the next stage.
Payment Checkout (checkout/[id])	Mobile	Stripe Payment Sheet: Sender-side payment screen. Shows the agreed reward, BootHop commission (5%), and total amount. Uses Stripe React Native SDK (useStripe hook) with a native payment sheet. Calls /api/checkout/[matchId] to get a Stripe PaymentIntent client secret, ephemeral key, and customer ID. The Stripe payment sheet is presented natively. On payment success, match moves to payment_processing and admin is notified. On failure, error is shown and user can retry. <i>Stripe is used here for payment collection - this is different from the manual escrow model described on the web. The mobile app uses Stripe payment processing.</i>
Chat (chat/[matchId])	Mobile	Match Chat Thread: In-app real-time chat between the matched sender and carrier. Messages are loaded from /api/messages/[matchId] and updated via polling (every 5 seconds). Send bar at bottom with text input and photo attachment button. Each message shows sender avatar, timestamp, and read status. Contact detail masking is active until payment is confirmed (admin-side action). System messages ("Admin has confirmed payment - contact details shared") appear inline.

SECTION 5 - DELIVERY AND SEALING SCREENS

Package sealing, delivery confirmation, PIN handover, and issue reporting

QR Seal Activation (seal/[id])	Mobile	Package Seal & QR Generation: Carrier-side sealing screen. Shows the match summary and generates a unique QR code for the package (rendered via react-native-qrcode-svg). Steps: (1) Take a photo of the sealed package (expo-camera), (2) Enter confirmed package weight, (3) Optionally scan the printed QR label to verify it matches (QR scanner via expo-camera), (4) Tap "Activate Seal" - submits photo, weight, and QR token to /api/seal/[id]/activate. Seal activation is timestamped and geo-logged. Seal must be activated before transit begins. <i>The generated QR token is cryptographically linked to this specific match and is single-use.</i>
Seal Confirmation (seal/[id]/confirm)	Mobile	Seal Confirm Screen: Post-activation confirmation. Shows: the activated seal number, activation timestamp, package weight as recorded, and a preview of the QR code. Option to share the QR code image via the native share sheet (WhatsApp, email, AirDrop). Also shows the next action: "Your package is sealed and ready for transit. You'll be notified when the carrier reports departure."

Delivery Confirmation (deliver/[id]/confir	Mobile	Confirm Delivery Received: Sender-side confirmation screen. Shows item description, route, and carrier name. "I confirm this item has been delivered to me" button. On tap, calls /api/matches/[id]/confirm-delivery with the sender role. Shows a pending state while waiting for the carrier's confirmation. Once both parties confirm, the match moves to delivery_confirmed and admin is prompted to release escrow.
Delivery PIN (deliver/[id]/pin)	Mobile	Delivery PIN Entry: PIN-based final handover verification. The sender was given a 4-digit PIN at the point of match. At delivery, the carrier asks the recipient to provide the PIN. Carrier enters the PIN on this screen - if it matches the stored hash, the delivery is logged as confirmed on the carrier's side. Adds an extra layer of fraud prevention (prevents carrier marking false deliveries).
Delivery Report (deliver/[id]/report)	Mobile	Report a Delivery Issue: Issue reporting screen accessible to both parties if something went wrong with the delivery. Issue categories: Item Damaged, Item Missing, Wrong Item Delivered, Carrier Did Not Arrive, Sender Not Available, Seal Broken on Receipt, Other. Free-text description field (required). Photo upload (optional). Submitting opens a formal dispute, notifies both parties and admin, and pauses escrow release until resolved.

SECTION 6 - TRACKING SCREENS

Package status tracking via barcode scan and live GPS map

Barcode Tracking (track/[barcode])	Mobile	Barcode / QR Scan Tracking: Publicly accessible tracking screen reached by scanning a package QR code (no login required for basic status). Shows: Package Status Timeline (9 steps from Match Made -> Completed, with colour-coded progress bar), Status Label and Icon per step, Last Update Timestamp. For logged-in users who are party to the match, shows additional detail: carrier name, live tracking link, and action buttons. Fetches status from /api/track/[barcode]. <i>The 9-step status timeline mirrors the match state machine: matched, agreed, committed, kyc_complete, locked_pending_compliance, compliance_in_progress, active, delivery_confirmed, completed.</i>
Live Tracking (track/live/[matchId])	Mobile	Live Delivery Map: Real-time carrier location tracking for an active (in-transit) delivery. Shows an interactive map (React Native Maps or Expo MapView) with the carrier's last reported GPS position, the delivery route drawn as a polyline from origin to destination, and the ETA based on current position. Location updates are pushed from the carrier's device every 2 minutes when the tracking is active. Only visible to the matched sender and admin.

SECTION 7 - BUSINESS SCREENS

Mobile interface for business delivery bookings

Business Booking (business/book)

Mobile

Mobile Business Job Booking: Business delivery booking screen for mobile users. Urgency selector: Planned / Priority / Same Day / Critical (each showing SLA description). Delivery type: UK Local / EU / International. Fields: Origin Address, Destination Address, Package Description, Estimated Weight (kg), Special Instructions. Calls /api/business/jobs to create the job. On success, navigates back to the Business tab showing the new job status.

Requires a linked business account. Personal users see an upgrade prompt.

MOBILE API LAYER - HOW THE APP CONNECTS TO THE BACKEND

Base URL (constants/index.ts): API_BASE = "https://www.boothop.com/api"

Every API call in the mobile app targets the same Next.js Route Handler endpoints as the web application. The mobile app adds an Authorization header (Bearer <JWT from SecureStore>) to authenticated requests. The web app uses an httpOnly cookie - both are validated by the same session middleware on the server.

Key API endpoints used by mobile:

- /api/auth/send-otp, /api/auth/verify-otp - Authentication
- /api/journeys, /api/journeys/create - Journey marketplace
- /api/trips (type: request) - Delivery requests
- /api/matches/[id], /api/messages/[matchId] - Match & chat
- /api/declarations/[id], /api/seal/[id]/activate - Compliance
- /api/checkout/[matchId] - Stripe payment (mobile uses Stripe SDK)
- /api/track/[barcode] - Package tracking
- /api/ai/safety-check - AI compliance check (available, not yet wired into mobile journey create)
